

# Introduction to Machine Learning

## Supervised Classification: In a Nutshell

### Learning goals

- Understand basic concept of classifiers
- Know concepts of probabilistic and scoring classifier
- Know distinction between discriminant and generative approach
- Understand ideas of logistic regression and Naive Bayes

# CLASSIFICATION TASKS

- Learn function that assigns categorical class labels to observations
- Each observation belongs to exactly one class
- The task can contain two (binary) or multiple (multi-class) classes

Training

Prediction

# BASIC DEFINITIONS

- For every observation a model outputs the probability (probabilistic classifier) or score (scoring classifier) of each class
- In the multi-class case, the class label is usually assigned by choosing the class with the maximum score or probability
- In the binary case, a class label is assigned by choosing the class whose probability or score exceeds a threshold value  $c$

Input: Unlabeled data

Sex	Age	Health	Degree of Graduation	Level of Happiness
Male	41	Fair	Bachelor	?

Classifier

Class Probabilities

Probability	Level of Happiness
0.4	Not too happy
0.35	Pretty happy
0.25	Very happy

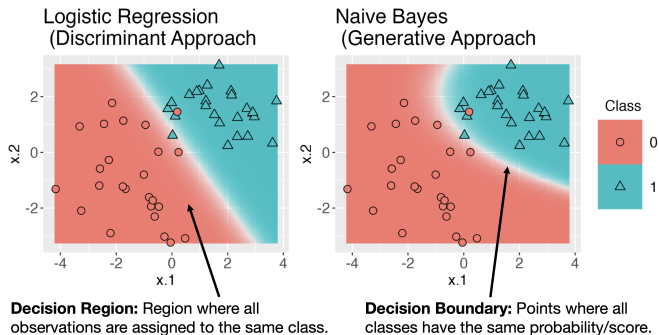

Assigned Label

Level of Happiness
Not too happy

# BASIC DEFINITIONS / 2

Two fundamental approaches exist to construct a classifier:

- **Discriminant approach** asks “What is the best prediction for the class given these data?” (uses loss functions and empirical risk minimization)
- **Generative approach** asks “Which class tends to have data like these?” (models the feature distributions in each class separately)

# LOGISTIC REGRESSION

- Logistic regression is a **discriminant approach** for binary classification. It turns scores into probabilities with the logistic function.
- We just need to compute the probability for **one** class (usually class 1).
- If the probability exceeds a threshold value **c**  $\Rightarrow$  class 1 is predicted.

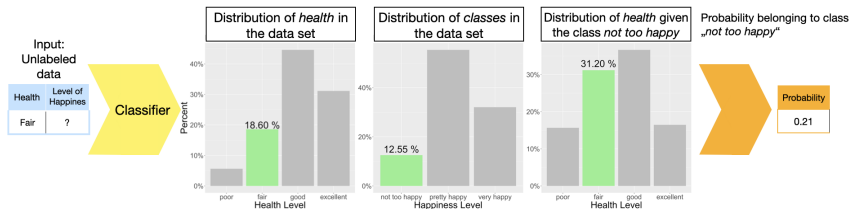

The logistic function puts all scores in order along an s-shaped line.

A 3x3 grid with 'X' marks at (1,1), (1,2), (2,1), (3,1), and (3,2), and 'O' marks at (1,3), (2,2), and (3,3). A blue line starts at the top left, goes right, then down, then right, separating the 'X' marks from the 'O' marks.

# NAIVE BAYES / 2

Example: Class probability of “not too happy” given health = “fair”:

Naive Bayes Classifier

Class probability given the data

21.00 %
