

# Introduction to Machine Learning

## Hyperparameter Tuning In a Nutshell

### Learning goals

- Understand the main idea behind tuning,
- fulfilling the untouched-test set principle via nested resampling,
- and pipelines

# WHAT IS TUNING?

- Tuning is the process of selecting the best hyperparameters, denoted as  $\lambda$ , for a machine learning model.
- Hyperparameters are the parameters of the learner (versus model parameters  $\theta$ ).
- Consider a guitar analogy: Hyperparameters are akin to the tuning pegs. Learning the best parameters  $\hat{\theta}$  – playing the guitar – is a separate process that depends on tuning.

# WHY TUNING MATTERS

- Just like a guitar won't perform well when out-of-tune, properly tuning a learner can drastically improve the resulting model performance.
- Tuning helps find a balance between underfitting and overfitting.

Comparing AUCs of different values for hyperparameters *maxdepth*, *k*, *gamma*, and *C*

## NAÏVE APPROACHES

Goal: Find a best configuration  $\lambda^* \in \arg \min_{\lambda \in \Lambda} \widehat{\text{GE}}(\mathcal{I}, \rho, \lambda)$

⇒ Tuners  $\tau$ , e.g., **Grid Search** and **Random Search**, output a  $\lambda^*$

## Grid Search

## Random Search

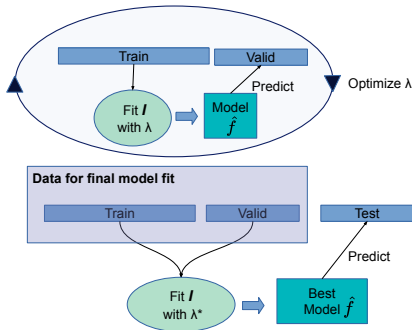

Sophisticated techniques, based on assumptions about the objective function, search for optimal solutions more efficiently.

# UNTOUCHED-TEST-SET PRINCIPLE

We've found a  $\lambda^* \in \Lambda$ . How well does it perform?

- **Careful:** We cannot use the same data for both tuning and performance estimation, as this would lead to (optimistically) biased performance estimates!
- To obtain an unbiased  $\widehat{GE}$ , we need an **untouched** test set:

# NESTED RESAMPLING

To decrease variance of the  $\widehat{GE}$ , **Nested Resampling** is used:

- Just as we generalized holdout splitting to resampling, we generalize the three-way split to nested resampling (as we first have to find  $\lambda^*$ ):

# PIPELINES IN MACHINE LEARNING

Pipelines are like the assembly lines in machine learning. They automate the sequence of data processing and model building tasks.

## Why Pipelines Matter:

- **Streamlined Workflow:** Automates the flow from data preprocessing to model training.
- **Reproducibility:** Ensures that results can be reproduced consistently.
- **Error Reduction:** Minimizes the chance of human errors in the model building process.
