# **Introduction to Machine Learning**

# Supervised Classification In a Nutshell

#### Learning goals

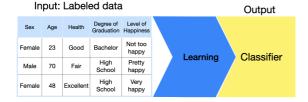

- Understand basic concept of classifiers
- Know concepts of probabilistic and scoring classifier
- Know distinction between discriminant and generative approach
- Understand ideas of logistic regression and Naive Bayes

### **CLASSIFICATION TASKS**

- Learn function that assigns categorical class labels to observations
- Each observation belongs to exactly one class
- The task can contain two (binary) or multiple (multi-class) classes

#### **Training**

#### Prediction

#### **BASIC DEFINITIONS**

- For every observation a model outputs the probabilistic classifier) or score (scoring classifier) of each class
- In the multi-class case, the class label is usually assigned by choosing the class with the maximum score or probability
- In the binary case, a class label is assigned by choosing the class whose probability or score exceeds a threshold value c

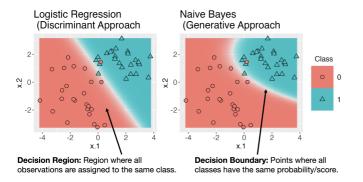

#### **BASIC DEFINITIONS**

Two fundamental approaches exist to construct a classifier:

- Discriminant approach asks "What is the best prediction for the class given these data?" (uses loss functions and empirical risk minimization)
- Generative approach asks "Which class tends to have data like these?" (models the feature distributions in each class separately)

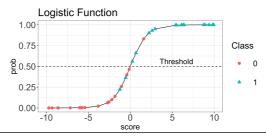

## LOGISTIC REGRESSION

- Logistic regression is a discriminant approach for binary classification.
  It turns scores into probabilities with the logistic function.
- We just need to compute the probability for **one** class (usually class 1).
- ullet If the probability exceeds a threshold value  ${f c} \Rightarrow$  class 1 is predicted.

× × ×

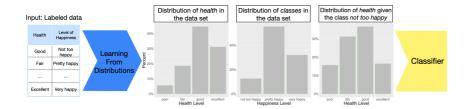

The logistic function puts all scores in order along an s-shaped line.

#### **NAIVE BAYES**

- Naive Bayes is a generative multi-class approach. It computes the class probability for each class based on the training data.
- It considers the data distribution on three different levels:
  - Marginal distributions  $\mathbb{P}(X)$  of each feature (in the entire data set)
  - Marginal distribution  $\mathbb{P}(Y)$  of classes (in the entire data set)
  - Conditional distributions  $\mathbb{P}(X|Y)$  of each feature in each class

#### **NAIVE BAYES**

• Example: Class probability of "not too happy" given health = "fair":
